

Four Bartonella genomes

Nine annotated CDS around rpoB in each genome | all pairs

36 annotated CDS; 46 reciprocal-best protein links within the selected windows.
BLASTp: $\geq 50\%$ identity, $\geq 70\%$ coverage of both proteins, $E \leq 1e-20$; tied best hits excluded.
Colors identify gene names or abbreviated products; arrows show strand. HP: hypothetical protein.
These are local windows drawn around a circle, not complete circular gene maps.
