

Three hospital-associated plasmids

Annotated CDS fully inside the 2,000-10,700 bp backbone window | all pairs

33 annotated CDS; 31 reciprocal-best protein links within the selected windows.
BLASTp: $\geq 50\%$ identity, $\geq 70\%$ coverage of both proteins, $E \leq 1e-20$; tied best hits excluded.
Colors identify gene names or abbreviated products; arrows show strand. HP: hypothetical protein.
These are local windows drawn around a circle, not complete circular gene maps.
