

A Conserved blocks connect different chromosome-arm arrangements

380 published blocks | five arms per species | colour follows the *An. gambiae* arm

Jiang et al. (2014), doi:10.1186/s13059-014-0459-2; published signed block orders.
Equal-width blocks; track lengths count blocks, not base pairs. Circular placement does not imply circular chromosomes.
Source stephensi map covers ~62% of the assembly; only 32/86 mapped scaffolds had experimental orientation.
Opposite-orientation blocks are not inversion-event counts or evidence of effects on malaria transmission.
