

Each genome has its own tracks

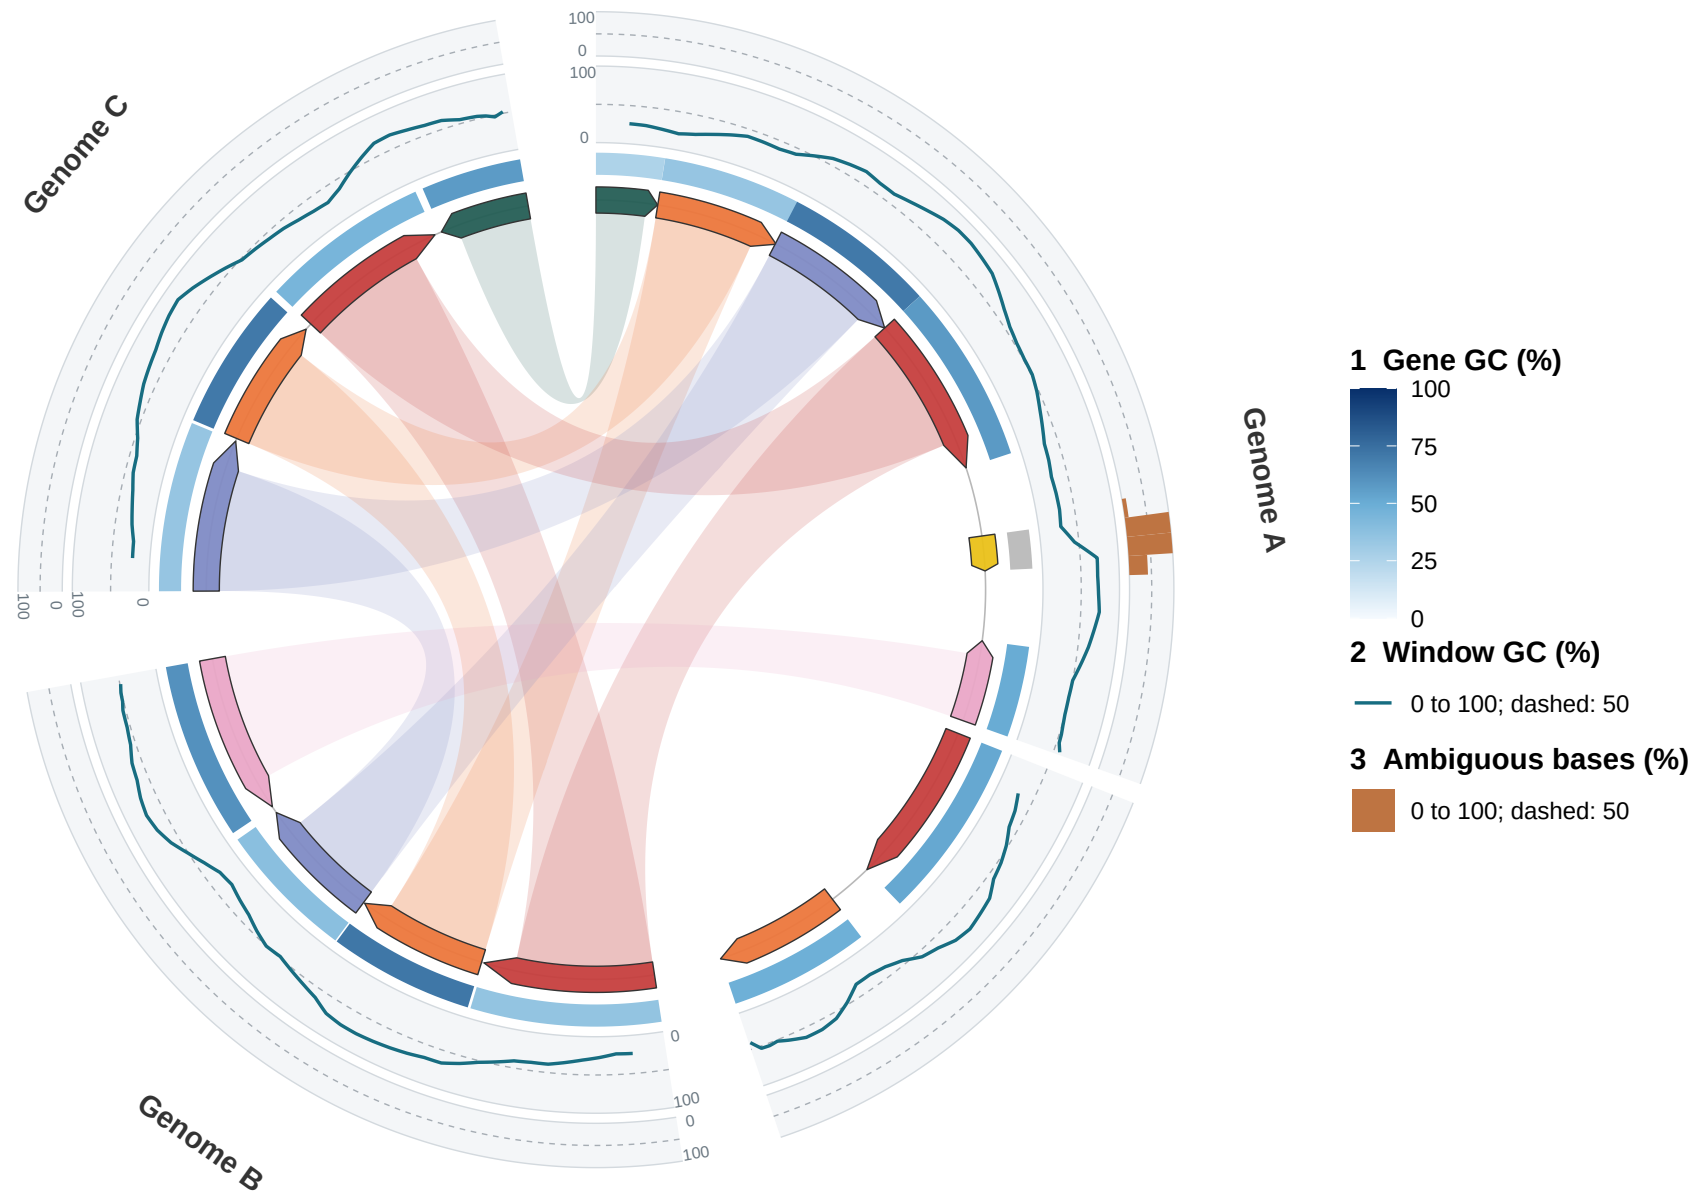

Genes, GC heatmap, GC line, then bars | ribbons occupy separate gaps

Simulated DNA. GC line: 400-base windows every 100 bases. Grey heatmap cells have no called bases.
Linear example: middle guides and backgrounds removed; track borders styled separately.

The same three tracks around the genes

Values increase outward within each ring | each track keeps its own scale

Simulated DNA. Tracks from genes outward: gene GC heatmap, window GC line, ambiguous-base bars.
GC line: 400-base windows every 100 bases; dashed guide = 50%. Grey heatmap cells have no called bases.
